

Changing postfix's incoming smtp port

Which line to change to have Postfix listen on specific ports are well?

This is one of the most simple tasks, yet I had to Google around for hours: change the incoming port of postfix's SMTP, without iptables prerouting.

Open `/etc/postfix/master.cf`, and search for the following line (usually the first uncommented line):

```
smtp      inet  n       -       -       -       smtpd
```

```
apache
```

To change the port, simply write the number instead of smtp in the begining.

For example:

```
2525     inet  n       -       -       -       smtpd
```

```
apache
```

Restart postfix

```
/etc/init.d/postfix restart
```

```
bash
```

and the system can not accept messages on the port you added. Don't forget to enable the port on your firewall, if you have one!
