

# WordPress Jetpack: deactivate any module

---

How to disable any module of JetPack for WordPress.

---

After I've installed the JetPack module I saw a lot of plugins I don't need at all but I did not have a deactivate button for them. To make them deactivated, you'll need a bit of database hacking:

To show the active modules list:

```
SELECT * FROM wp_options WHERE  
option_name='jetpack_active_modules';
```

sql

The output should be something like this:

```
+-----+-----+-----+  
+-----+-----+-----+  
| option_id | option_name           | option_value  
| autoload |  
+-----+-----+-----+  
+-----+  
|      254164 | jetpack_active_modules | a:1:{i:0;s:5:"stats";} |  
| yes      |  
+-----+-----+-----+  
+-----+  
1 row in set (0.00 sec)
```

sql

To deactivate ALL the modules ( you will be able to activate one by one after this )

```
UPDATE wp_options SET option_value='' WHERE  
option_name='jetpack_active_modules';
```

sql
