

# Monitor specific website with Monit

---

How to: monitor the health of a remote web address with Monit.

---

Most of the examples of Monit checking a web address' health is for localhost and in connection with checking the apache process. However, in case you want to monitor remote addresses, you'll need this:

```
check host domain.com with address domain.com every 6
cycles
    if failed port 80 protocol http for 5 cycles then alert
    alert your.email@provider.com { connection, timeout }
with mail-format {
    from: monit@your-server.com
    subject: $EVENT at $DATE on $HOST
    message: domain.com is unreachable from your-
server.com server
}
```

apache
